3D列印的工作原理

- 將3D模型分割成數個切片，印表機將印製切片，並堆放在前一個切片上，切片堆疊後形成立體物件。
- 1983年，美國Charles Hull發表3D列印技術(Stereolithography, SLA)，也首次提出3D列印模型stl格式。
- 以前，3D列印稱為快速成型(Rapid Prototyping , RP)。
- 2009年，美國材料試驗協會正式命名積層製造(Additive Manufacturing, AM)。

3D列印之父 Charles Hull

Charles Hull在1983年發明了SLA (Stereolithography, 液態樹脂固化或光固化) 3D列印技術，隨後於1984年申請美國專利，1986年獲得有史以來第一件結合電腦繪圖、固態雷射與樹脂固化技術的3D列印技術之專利憑證(US 4,575,330);同一年，他也在加州成立了業界知名的3D Systems公司，大力推動相關的業務。

Charles Hull最近在美國進入美國發明家名人堂(NIHOF)，同在名人堂的有亨利福特和史提夫·賈伯斯。

[57] ABSTRACT

Apparatus incorporating a movable dispensing head provided with a supply of material which solidifies at a predetermined temperature, and a base member, which are moved relative to each other along "X," "Y," and "Z" axes in a predetermined pattern to create three-dimensional objects by building up material discharged from the dispensing head onto the base member at a controlled rate. The apparatus is preferably computer driven in a process utilizing computer aided design (CAD) and computer-aided (CAM) software to generate drive signals for controlled movement of the dispensing head and base member as material is being dispensed.

Three-dimensional objects may be produced by depositing repeated layers of solidifying material until the shape is formed. Any material, such as self-hardening waxes, thermoplastic resins, molten metals, two-part epoxies, foaming plastics, and glass, which adheres to the previous layer with an adequate bond upon solidification, may be utilized. Each layer base is defined by the previous layer, and each layer thickness is defined and closely controlled by the height at which the tip of the dispensing head is positioned above the preceding layer.
